

The Biblical Flood: Global Warming & Bush's Harvest

by William W Morgan

The big problem with global Warming is the “unknown factor”. What will happen where and how much. I do not believe there is now any question that temperatures are rising, seas will rise, there will be ice storms, desertification and many other unpleasant things.

But there is one very major and critical thing that is known. Something having profound importance for our species. At some time we could reach a point *where a process will start that we can not stop. And we will become extinct*, No recourse.

Such as the melting of the methane hydrates at the bottom of the oceans. Releasing tens of billions of tons of methane into the atmosphere. Causing temperature to rise to a point not seen in 4 billion years. All life as we know it will be incinerated.

There is another consideration of equal magnitude and importance. That is *Global Dumbing*. The societal system that has not allowed us to solve even one of our societal systems. A societal system based on coercion.

A system under which we can not make health-care, pension or school system work. End poverty, famine & unemployment. Stop crime and wars that kill tens of millions of people. This tells us that we must get rid of our societal system based on politics. **That Global Warming is too important to be left to politics and the “public” sector.**

If we do not change to a rational and durable societal system, this alone will make us extinct within a hundred years or less. About the same time scale as Global Warming...?

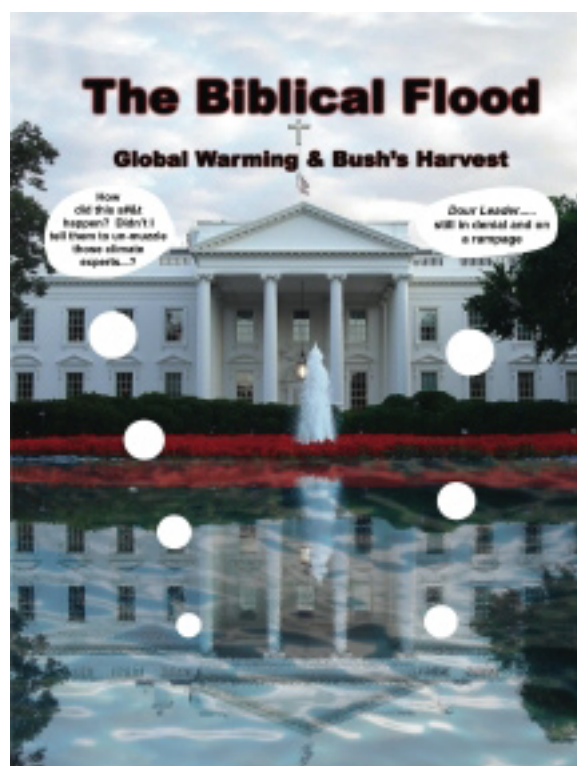

Thus, that we *must* first change to a rational and durable societal system *before* we can hope to solve the problems related to Global Warming.

There are many uncertainties. Yet there are two certainties: because of the uncertainties, we could suddenly reach a point of no return. With nothing we could do prevent us from extinction. The other certainty is that we will become extinct if we continue emissions at the current level.

Therefore, we must adopt a maximum individual “carbon footprint” that will result in total emissions being what they were in, say, 1960? Under penalty of certain extinction.

As reviewed by *New York Times* best-selling author **Ellen Tanner Marsh**:

“Morgan focuses on global warming... [and] the damage that has been orchestrated by the Bush administration... Global Dumbing, as he calls it, is simply our failure to think and to solve our societal problems... Why, he asks, do we have a social system that does not allow us to solve any of our great problems? ... Fierce, angry and provocative, Morgan argues for us to gently disengage from political systems... Brilliantly stated, this is a book that just could change the world”.

The Biblical Flood: Global Warming & Bush's Harvest

by William W Morgan

Global Warming

With credit to Dr. David Travis, we know of the problem of *Global Dimming* lurking behind Global Warming. The phenomenon that had prevented us from seeing the real amount of global warming.

This has its equivalent in our societal system, the problem of *Global Dumbing*. As described following under "Our Societal System"

Known

Seas will rise
Desertification and flooding
Ice storms and hurricanes
Methane hydrates will melt and we will have reached a point of no-return. With temperatures reaching a point not seen for 4 billion years. All life except perhaps single cell creatures will become extinct.

The resulting societal disorder will advance from *uncontrolled* to *uncontrollable*.

Unknown

How much and when
How much, where and when
Where and when
At what atmospheric and/or ocean temperature will this occur, and what calendar date.

When, not if, this will occur.

Our Societal System

As Global Warming carries its hidden problem of *Global Dimming*, our societal system has its hidden problem of *Global Dumbing*. Our ignorance related to the truth and reality of our societal system. The one under which we have never solved one of our basic societal problems

And it is this problem of *Global Dumbing* that will mitigate against our ability to solve the societal problems that will result from the effects of Global Warming.

Known

With this system we have failed to solve any of our societal problems.

We must change to a societal system where each individual is in *sole* and *total* control of their own life, has true job security and assumes responsibility for the results of their own life.

Unknown

When will our societal system self-destruct?

What is unknown is both *if* and *when* this change will occur

Solution

Our Societal System

Job Security
Total control over individual life
Individual responsibility for human action

Global Warming

Methane hydrate melting would be a *terminal, irreversible* situation.

With a safety factor, we must establish an atmospheric temperature and associated CO² ppm figure that will prevent this. And conform to it under penalty of death for the specie

Individuals, assuming responsibility for their own life, must conform to the "carbon footprint" that will ensure staying within the total maximum allowable CO² atmospheric levels

Which can not be accomplished with our present societal system

Ask anyone except a politician, "political scientist" or someone with an advanced degree if our present societal system really works. Is your life becoming steadily better or worse?
